

Providing HTTP Service on a Port

Goal: Configure and activate a http server bound to a specific port in LANforge.

This is useful if you want to provide an application layer target to interact with. This cookbook assumes you can access a shell prompt on the LANforge computer: the command-line instructions can be done at the system console, in a terminal over a remote desktop connection, or over `ssh`. The `nginx` service is only available on the Linux version of LANforge server.

Note: There are two web servers installed in a LANforge computer. The default web server is a stock version of Apache HTTPD that responds to all port 80 requests on all interfaces. For testing we recommend running Candela Technologies' version of Nginx on specific ports as covered in this cookbook. In contrast, Apache cannot bind to a network-device therefore we do not suggest running it.

Nginx can also be configured to listen to IPv6 traffic. Jump to the end of the cookbook for that technique.

1. Stop and disable LANforge system Apache instance.

A. Log into the LANforge computer as user lanforge

```
jreynolds@jed-shuttle:~ - Terminal
jreynolds@jed-shuttle ~
> ssh lanforge@192.168.100.40
```

B. Become super-user using the command `su -` (or `sudo -s`)

```
root@jed-f20:/home/lanforge - Terminal
[lanforge@jed-f20 ~]$ sudo -s
[root@jed-f20 lanforge]#
```

C. Stop the Apache service with `systemctl stop httpd`

```
root@jed-f20:/home/lanforge - Terminal
[root@jed-f20 lanforge]# systemctl stop httpd
[root@jed-f20 lanforge]#
```

D. If you want this setting to persist after a reboot, disable the service: `systemctl disable httpd`

```
root@jed-f20:/home/lanforge - Terminal
[root@jed-f20 lanforge]# systemctl stop httpd
[root@jed-f20 lanforge]# systemctl disable httpd
rm '/etc/systemd/system/multi-user.target.wants/httpd.service'
[root@jed-f20 lanforge]#
```

E. Set this as system default with: `systemctl daemon-reload`

```
root@jed-f20:/home/lanforge - Terminal
[root@jed-f20 lanforge]# systemctl stop httpd
[root@jed-f20 lanforge]# systemctl disable httpd
rm '/etc/systemd/system/multi-user.target.wants/httpd.service'
[root@jed-f20 lanforge]# systemctl daemon-reload
[root@jed-f20 lanforge]#
```

2. (Optional) There are other options for running Apache if you want to have both web servers available. You would not need stop and disable Apache, just restart it. You can change Apache to:

A. ...listen to a different port (like 81). Edit `/etc/httpd/conf/httpd.conf` and change the `Listen` option.

```
root@jed-f20:/etc/httpd/conf - Terminal
[root@jed-f20 lanforge]# cd /etc/httpd/conf
[root@jed-f20 conf]# nano httpd.conf
```

B. ...bind to a specific IP address, which is a good option if you configure the LANforge computer to have a fixed IP address on the management port. You would edit `httpd.conf` and change `Listen` to that specific IP address and port 80. Example: `Listen 192.168.1.40:80`

```
root@jed-f20:/etc/httpd/conf - Terminal
GNU nano 2.3.2 File: httpd.conf

# prevent Apache from glomming onto all bound IP addresses.
#
#Listen 12.34.56.78:80
Listen 80

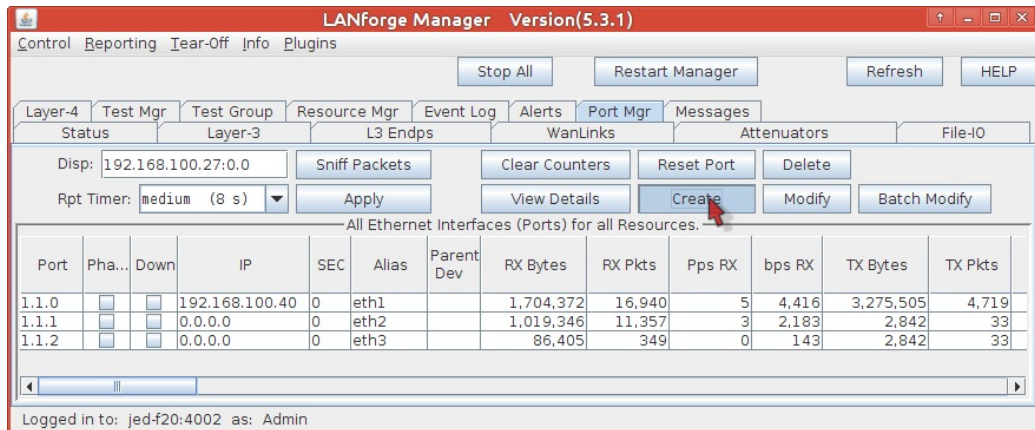

#
# Dynamic Shared Object (DSO) Support

^G Get Help ^O WriteOut ^R Read File ^Y Prev Page ^K Cut Text ^C Cur Pos
^X Exit ^J Justify ^W Where Is ^V Next Page ^U UnCut Text ^T To Spell
```

3. The demonstration test we'll create is making two ports, one for making requests and the other one for serving the protocol. Let's create two ports:

A. Create a redirect device:

A. In the Ports tab, click the **Create** button

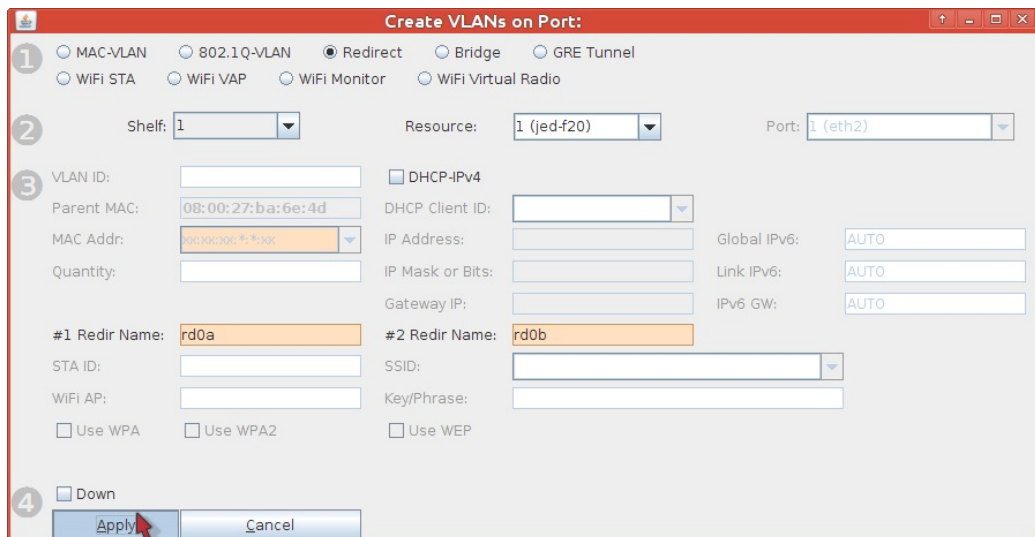

B. Select **Redirect**

C. Enter **rd0a** for #1 Redir name,

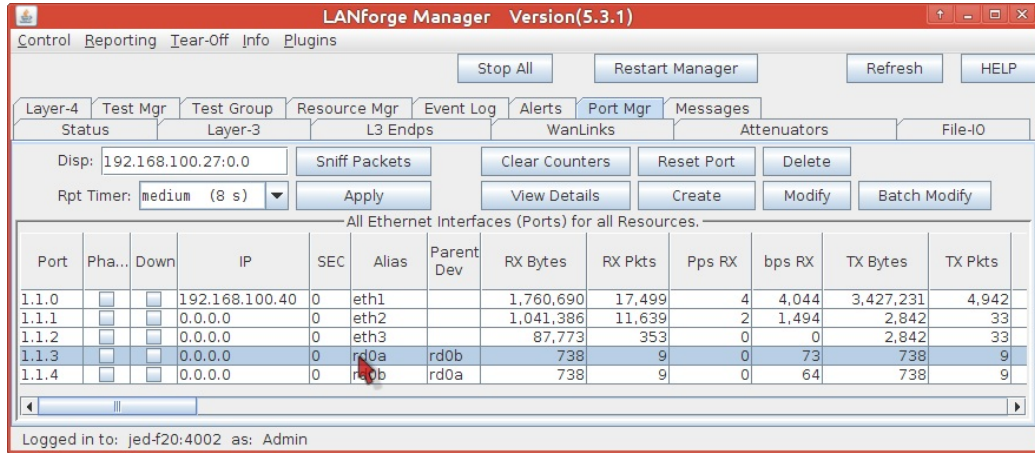

D. and **rd0b** for #2 Redir name.

E. Click **Apply** and then **Cancel** to close the window.

B. Configure **rd0a** as the service port:

A. In the Ports tab, double-click the row for port **rd0a**

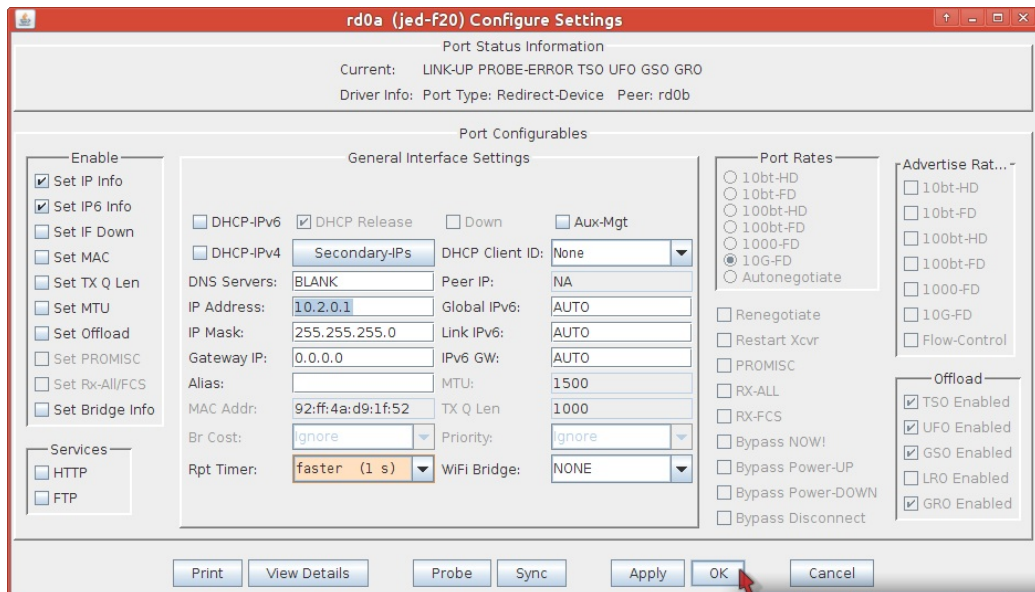

B. The Configure Settings window will appear

C. Set an IP of **10.2.0.1**,

D. a netmask of **255.255.255.0**

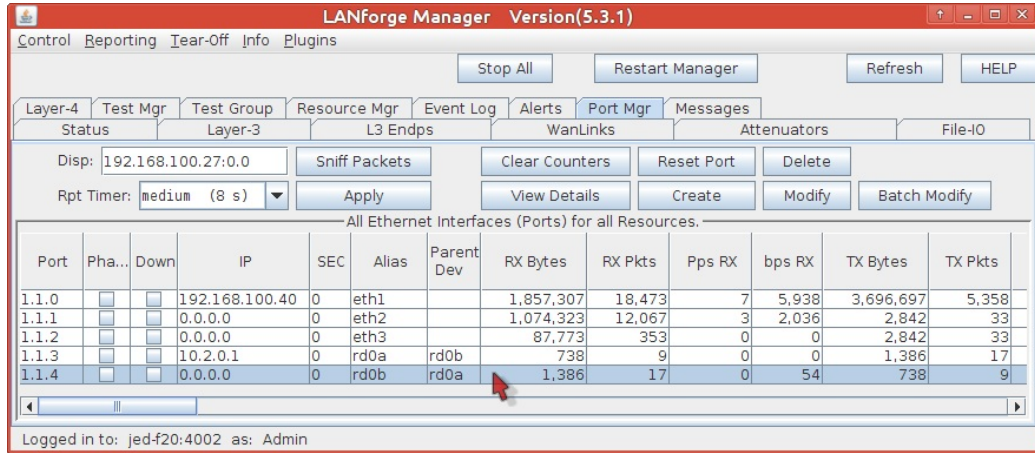

E. and the report time to faster (1 s).

F. Click **OK**

C. Configure **rd0b** as a client port

A. In the Ports tab, double-click the row for port **rd0b**

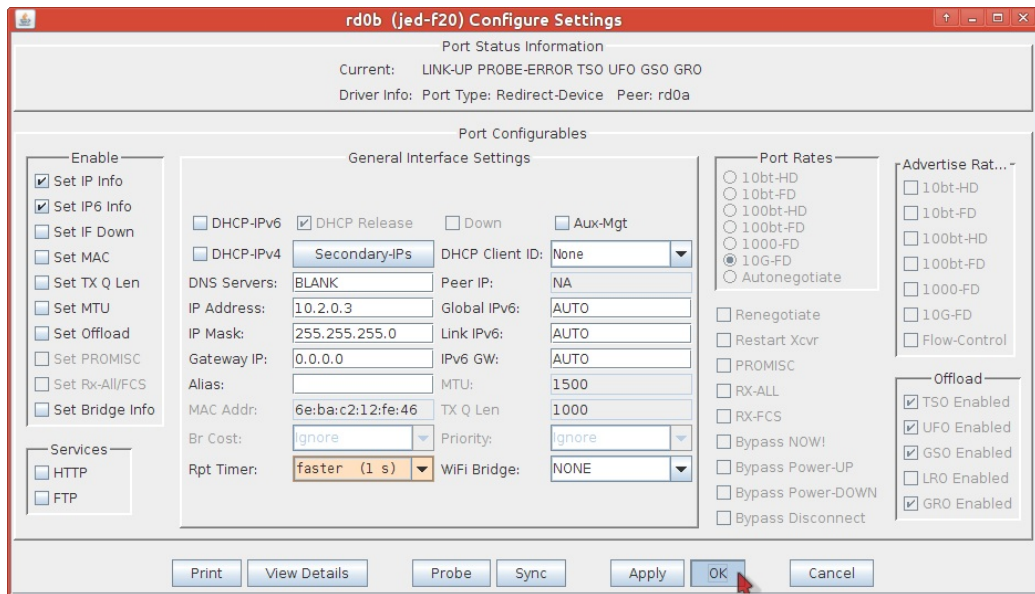

B. The Configure Settings window will appear

C. Set an IP of **10.2.0.3**,

D. a netmask of **255.255.255.0**

E. and the report time to faster (1 s).

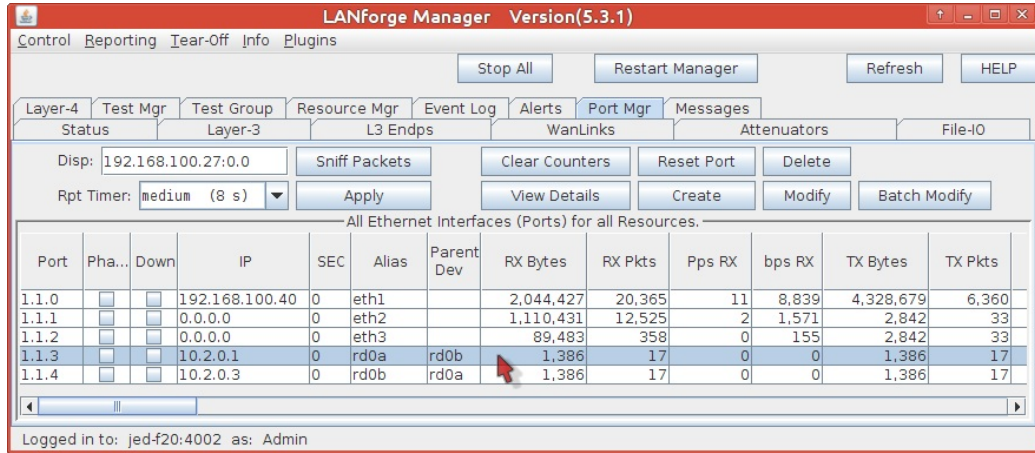

F. Click **OK**

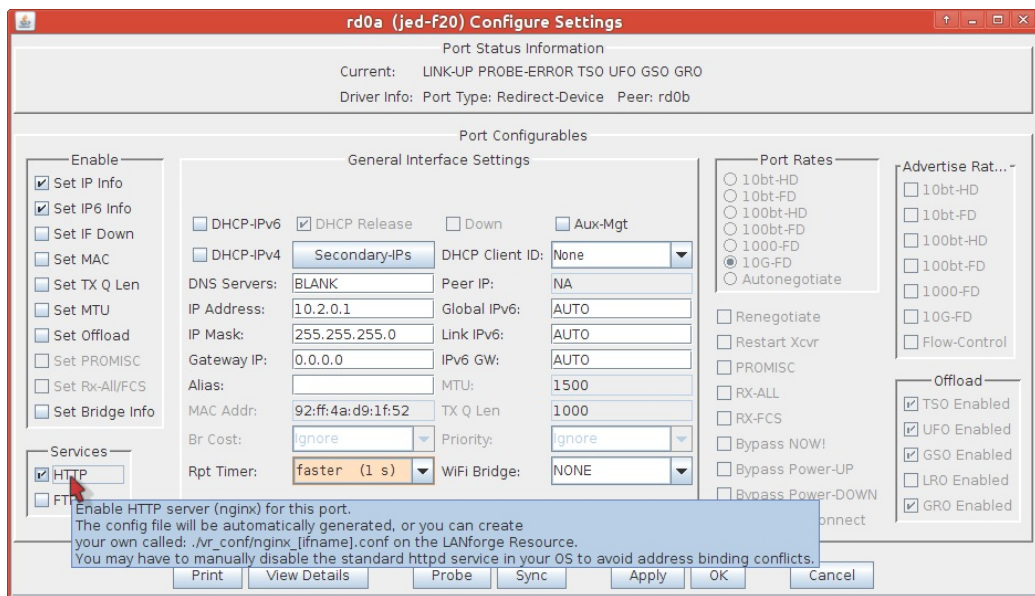

4. Enable HTTP service on your upstream port using the following steps.

A. Enable the nginx service on port **rd0a**:

- A. In the Ports tab, double-click the row for port **rd0a**

- B. The Configure Settings window will appear
- C. In the lower left column of the window, enable **HTTP** option.
- D. Click **OK** and then close the window.

B. (Optional) Modify the nginx config file for port **rd0a**. This example assumes you are logged into the LANforge system console, or have connected to the desktop using a remote-desktop client like vncviewer. If you are familiar with editing from the command-line, you will likely know how to do this via ssh.

- A. From the desktop Accessories menu, select Terminal Emulator,
- B. Change to the LANforge nginx directory: `cd /home/lanforge/vr_conf`

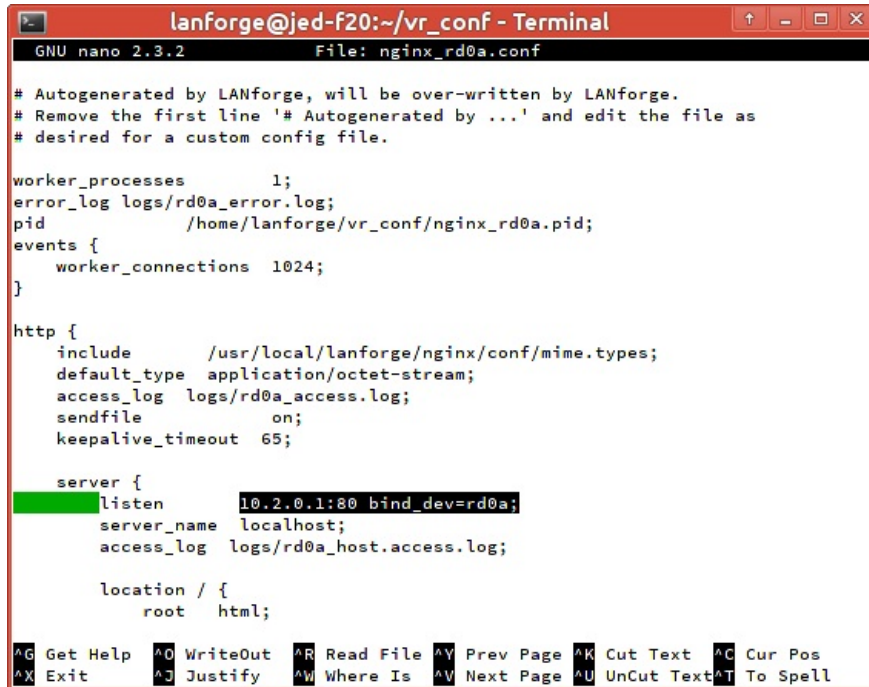

- C. Edit the file `nginx_rd0a.conf`. If you do not see the file, you might have connected to the wrong LANforge resource, or you might not have clicked OK/Apply when enabling the Configure Settings window for port `rd0a`.

```
lanforge@jed-f20:~/vr_conf - Terminal
[lanforge@jed-f20 vr_conf]$ nano nginx_rd0a.conf
```

- D. You will see that the listen directive is already set to `10.2.0.1:80 bind_dev=rd0a`;

```
lanforge@jed-f20:~/vr_conf - Terminal
GNU nano 2.3.2 File: nginx_rd0a.conf

# Autogenerated by LANforge, will be over-written by LANforge.
# Remove the first line '# Autogenerated by ...' and edit the file as
# desired for a custom config file.

worker_processes      1;
error_log logs/rd0a_error.log;
pid                   /home/lanforge/vr_conf/nginx_rd0a.pid;
events {
    worker_connections 1024;
}

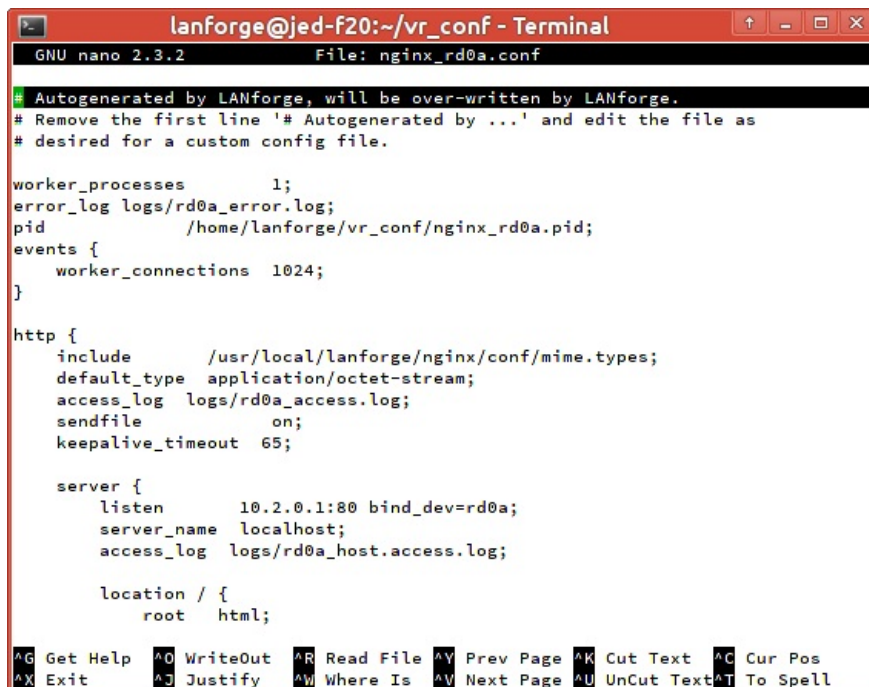

http {
    include             /usr/local/lanforge/nginx/conf/mime.types;
    default_type       application/octet-stream;
    access_log logs/rd0a_access.log;
    sendfile           on;
    keepalive_timeout 65;

    server {
listen 10.2.0.1:80 bind_dev=rd0a;
server_name localhost;
access_log logs/rd0a_host.access.log;

        location / {
            root html;
        }
    }
}

^G Get Help  ^O WriteOut  ^R Read File  ^Y Prev Page  ^K Cut Text   ^C Cur Pos
^X Exit      ^J Justify   ^W Where Is  ^N Next Page  ^U UnCut Text ^T To Spell
```

- E. If you want to change settings, delete the first line of the config file as part of your changes. This will signal LANforge not to overwrite the file.

```
lanforge@jed-f20:~/vr_conf - Terminal
GNU nano 2.3.2 File: nginx_rd0a.conf

# Autogenerated by LANforge, will be over-written by LANforge.
# Remove the first line '# Autogenerated by ...' and edit the file as
# desired for a custom config file.

worker_processes      1;
error_log logs/rd0a_error.log;
pid                   /home/lanforge/vr_conf/nginx_rd0a.pid;
events {
    worker_connections 1024;
}

http {
    include             /usr/local/lanforge/nginx/conf/mime.types;
    default_type       application/octet-stream;
    access_log logs/rd0a_access.log;
    sendfile           on;
    keepalive_timeout 65;

    server {
listen 10.2.0.1:80 bind_dev=rd0a;
server_name localhost;
access_log logs/rd0a_host.access.log;

        location / {
            root html;
        }
    }
}

^G Get Help  ^O WriteOut  ^R Read File  ^Y Prev Page  ^K Cut Text   ^C Cur Pos
^X Exit      ^J Justify   ^W Where Is  ^N Next Page  ^U UnCut Text ^T To Spell
```

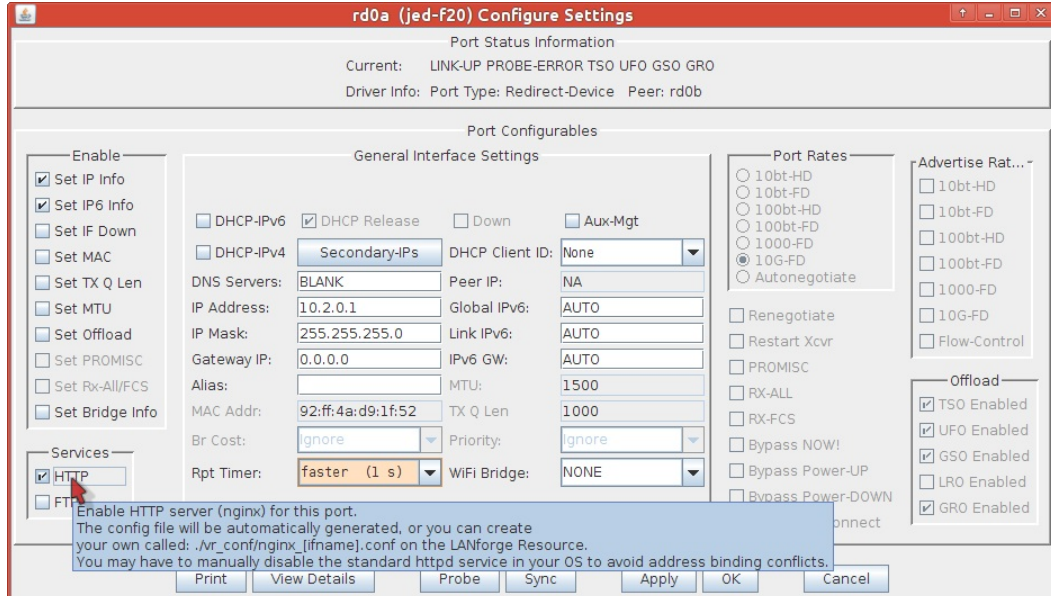

C. To apply the changes to the nginx service on this port:

A. Disable the HTTPD service in the rd0a Configure Settings window.

B. Click the **Apply** button,

C. Enable HTTPD service,

D. Click the **Apply** button,

E. Click the **Cancel** button to close the window if you are done.

D. A quick way to add a file into the nginx document root folder is to symlink the system dictionary there. You will need to be in a terminal or unix shell of the resource running nginx (192.168.100.40 in this example)

A. Change the ownership of the document root directory to user **lanforge**:

B. `sudo chown lanforge:lanforge /usr/local/lanforge/nginx/html`

```
lanforge@jed-f20:~ - Terminal
[lanforge@jed-f20 ~]$ sudo chown lanforge:lanforge /usr/local/lanforge/nginx/html
```

C. `cd /usr/local/lanforge/nginx/html`

```
lanforge@jed-f20:/usr/local/lanforge/nginx/html - Terminal
[lanforge@jed-f20 ~]$ sudo chown lanforge:lanforge /usr/local/lanforge/nginx/html
[lanforge@jed-f20 ~]$ cd /usr/local/lanforge/nginx/html/
[lanforge@jed-f20 html]$
```

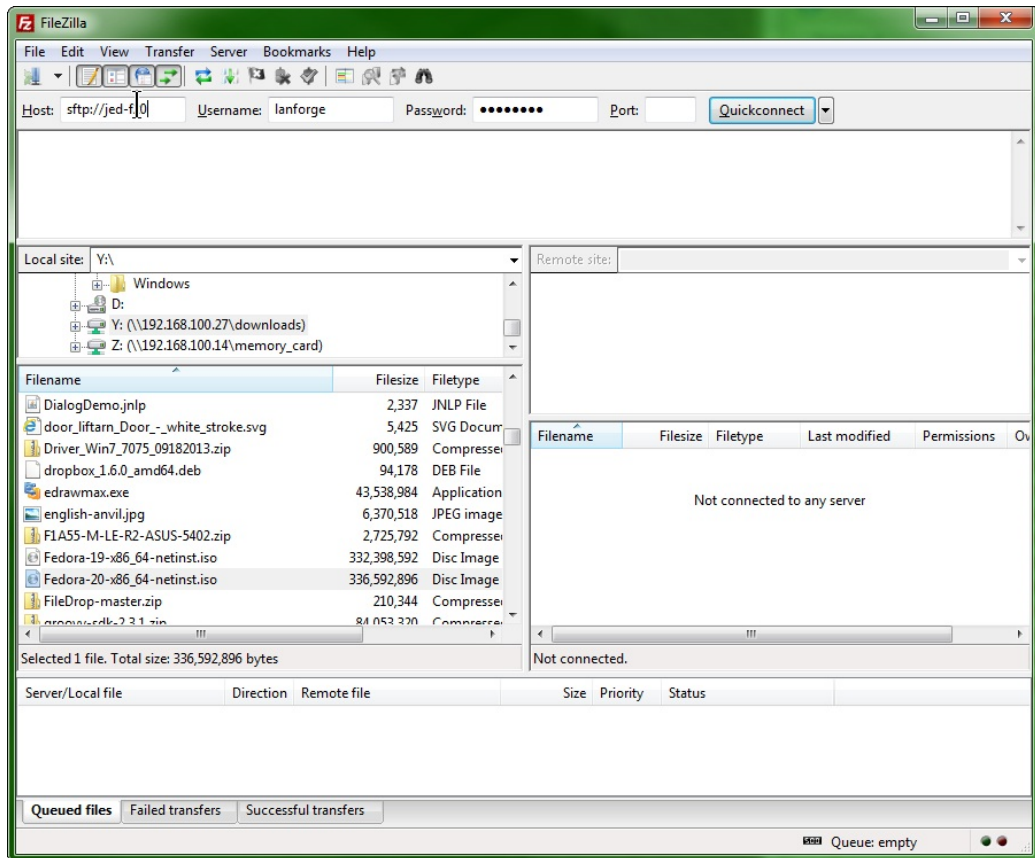

D. `ln -s /usr/share/dict/linux.words .`

```
lanforge@jed-f20:/usr/local/lanforge/nginx/html - Terminal
[lanforge@jed-f20 ~]$ sudo chown lanforge:lanforge /usr/local/lanforge/nginx/html
[lanforge@jed-f20 ~]$ cd /usr/local/lanforge/nginx/html/
[lanforge@jed-f20 html]$ ln -s /usr/share/dict/linux.words .
[lanforge@jed-f20 html]$
```

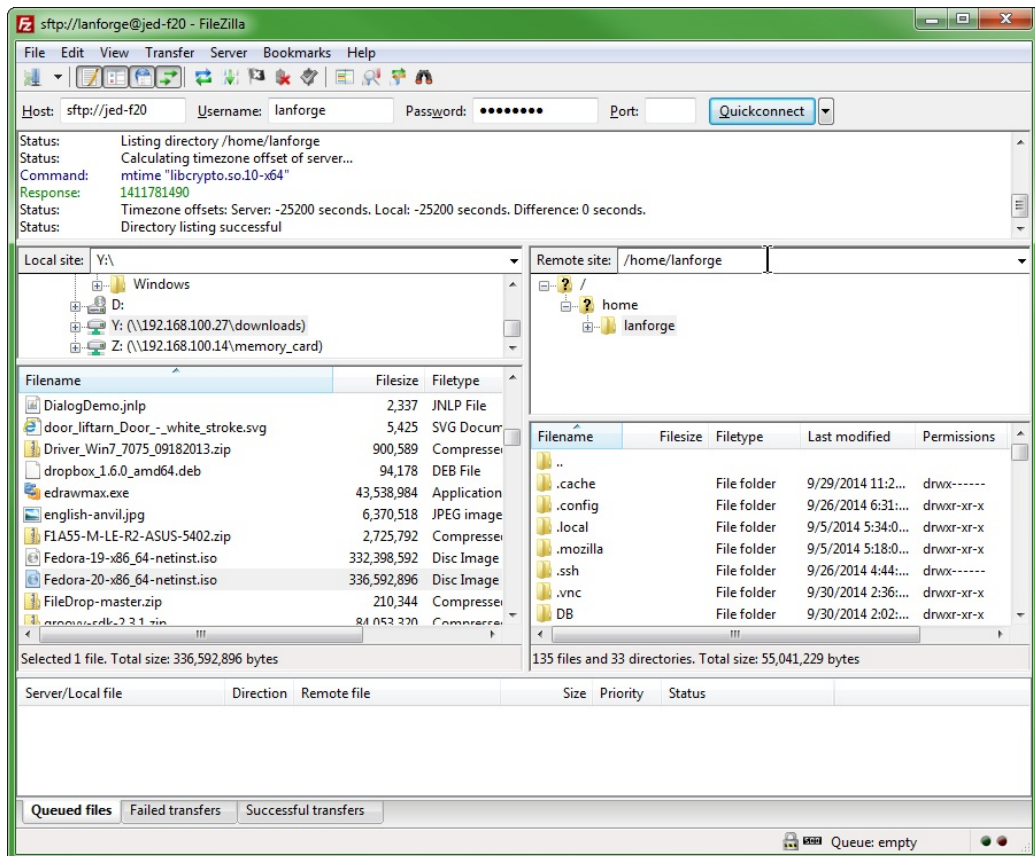

E. (Optional) To load a larger payload (such as a DVD file), you can use Filezilla (or scp) to copy the file over. You will want to have changed the nginx document root directory owner to lanforge (as above):

A. From your desktop, using FileZilla

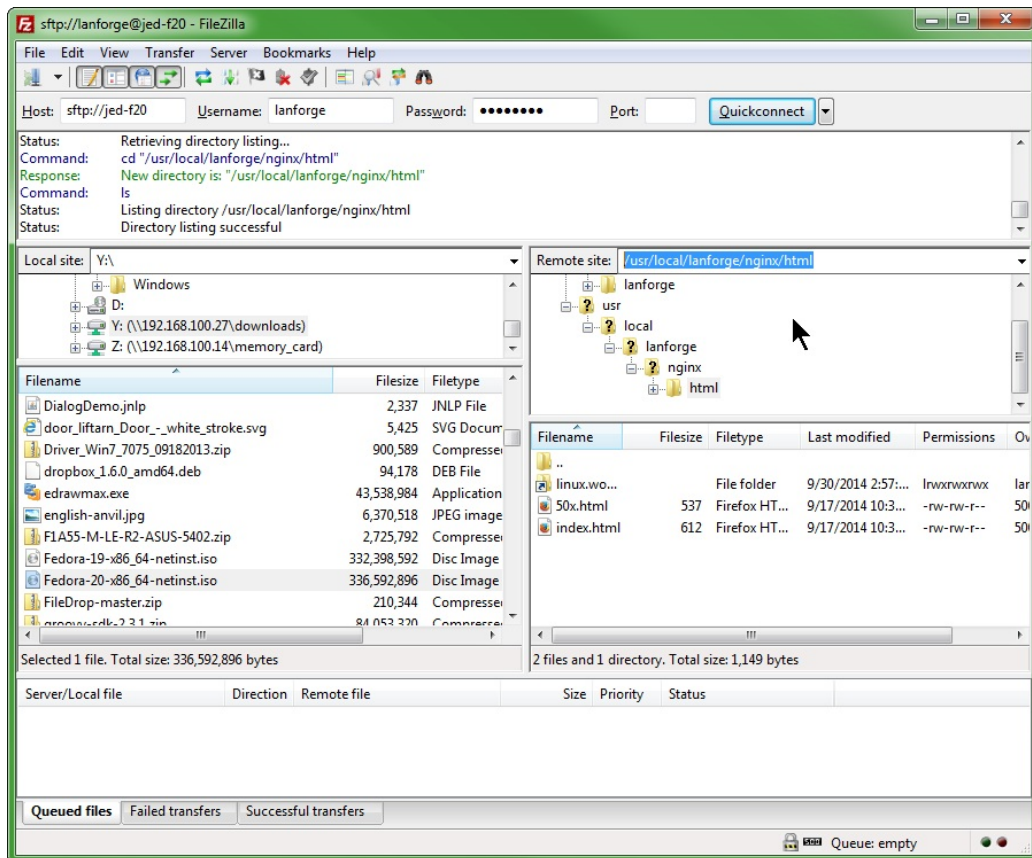

- I. quick connect to sftp://192.168.100.40 (also named jed-f20 in this example)
- II. using username `lanforge` and password `lanforge`

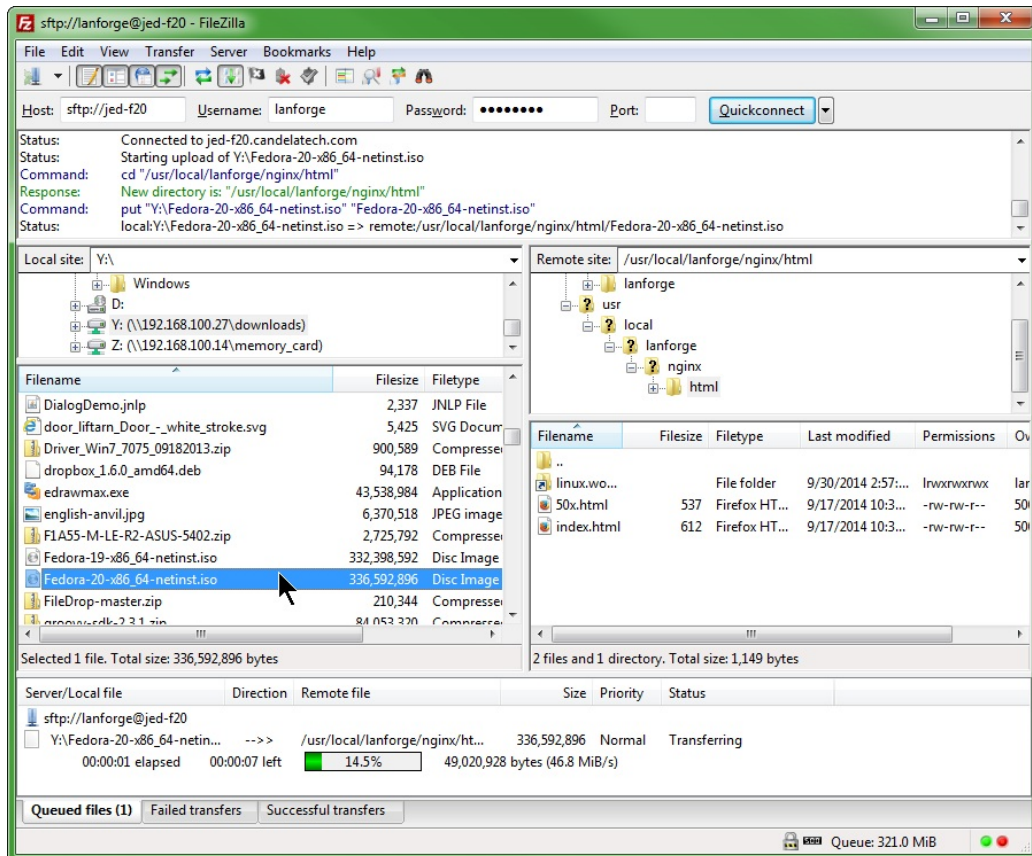

B. In the left column, choose your local directory (Y:\downloads)

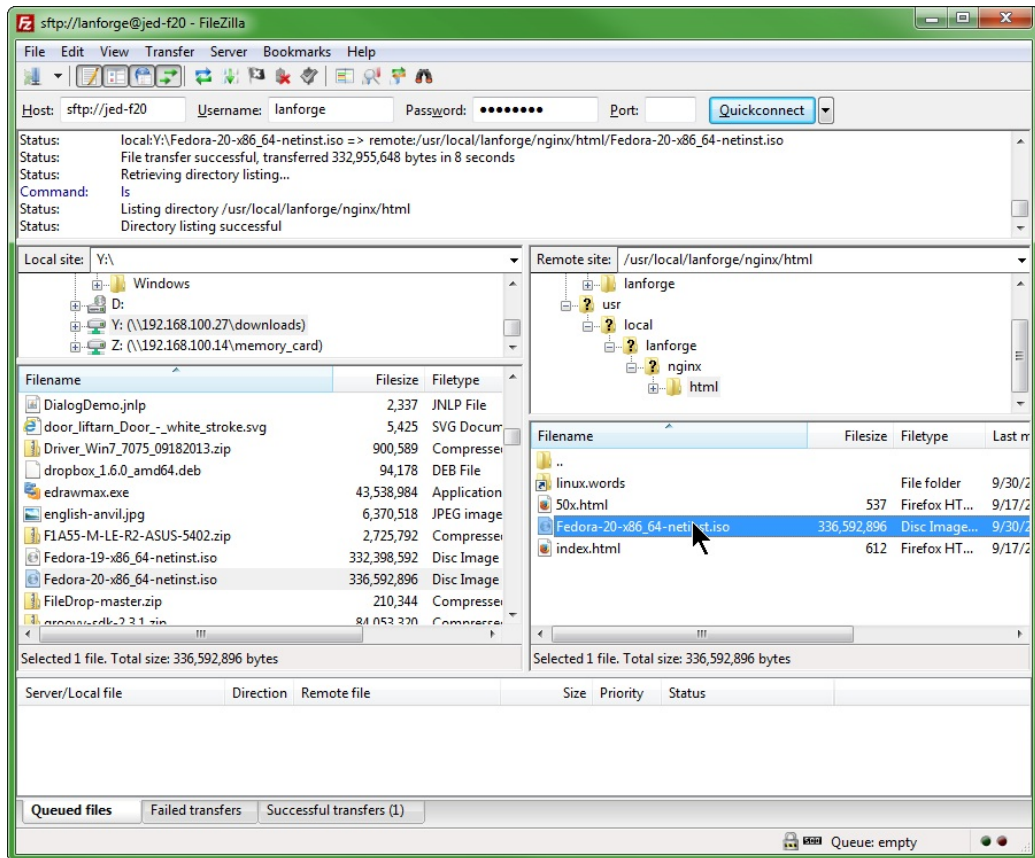

C. In the right column, type in the nginx document root, `/usr/local/nginx/html` and hit enter

D. In the left column, double-click your DVD image (Fedora-20-x86_64.netinst.iso)

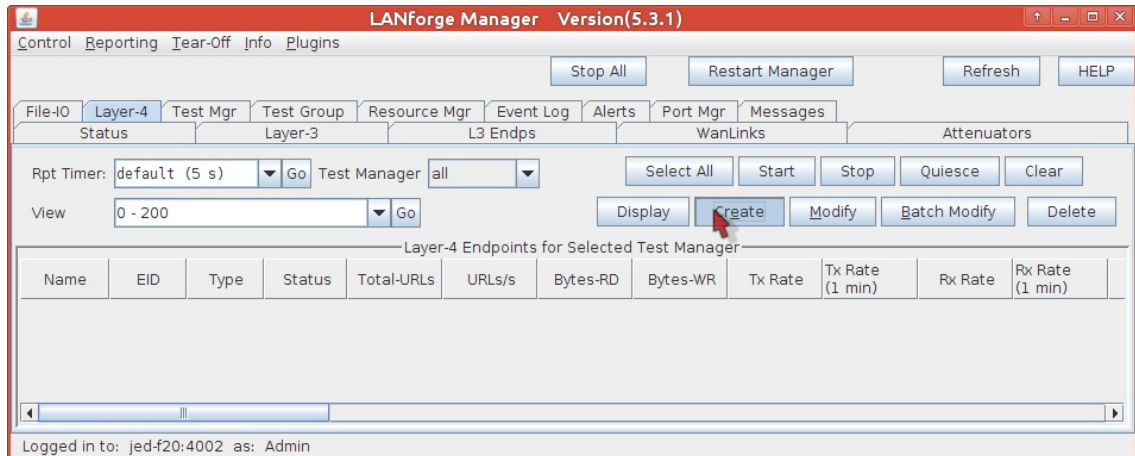

E. you will see the file when it is transferred appear in the right column

5. Configure application-layer traffic using the Layer 4-7 tab tools:

A. In the Layer 4-7 tab, click the **Create** button,

B. You will see the Create/Modify L4Endpoint window

C. Create a connection named `web-requests`,

D. With a Report timer of `fast (1 s)`

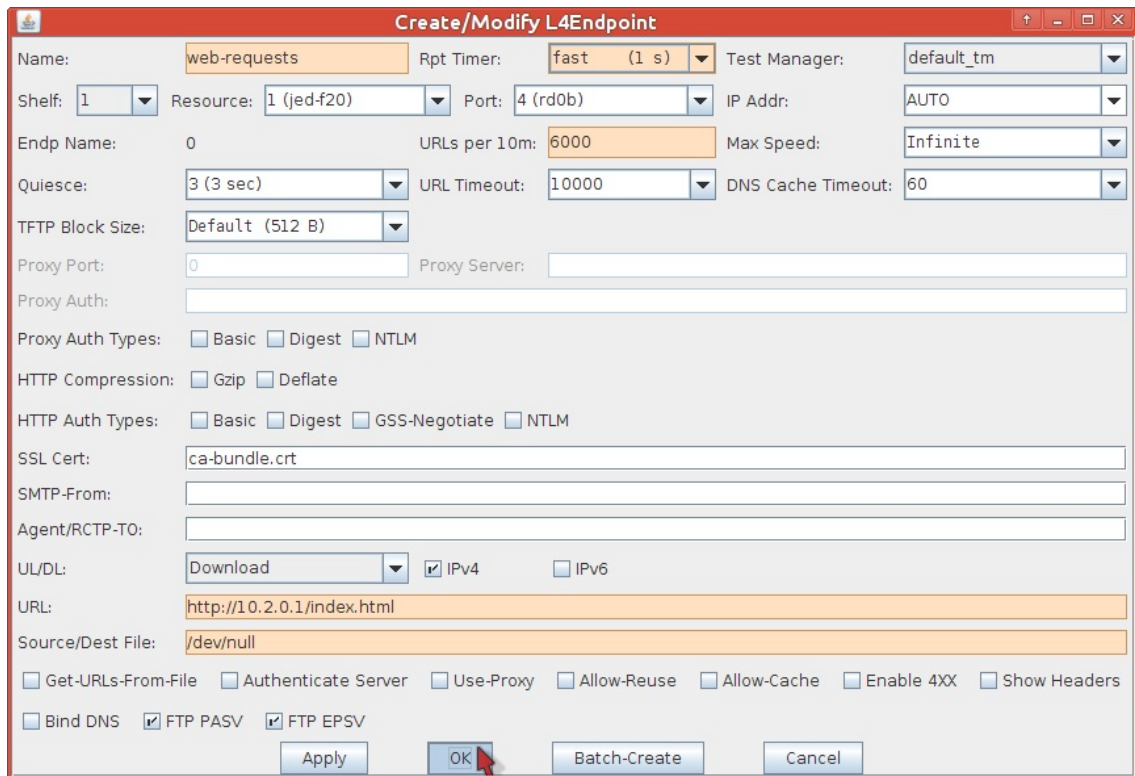

E. from Resource (jed-f20) port `rd0b`.

F. Let's make ten requests a second. Enter `6000` for URLs per 10m.

G. Jump down to the URL field, and enter `http://10.2.0.1/index.html`

H. and to avoid saving the result, set the Dest File to `/dev/null`

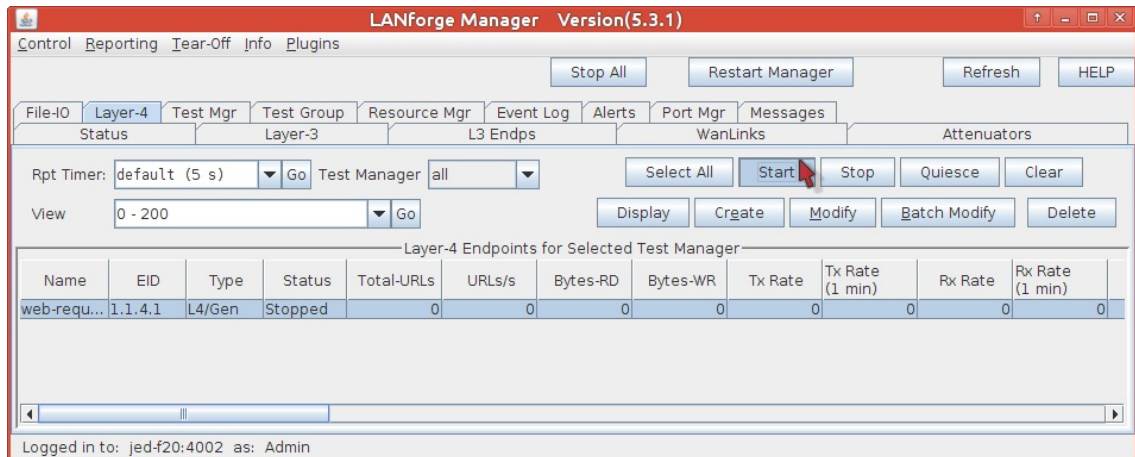

I. Click **OK** and the window will close.

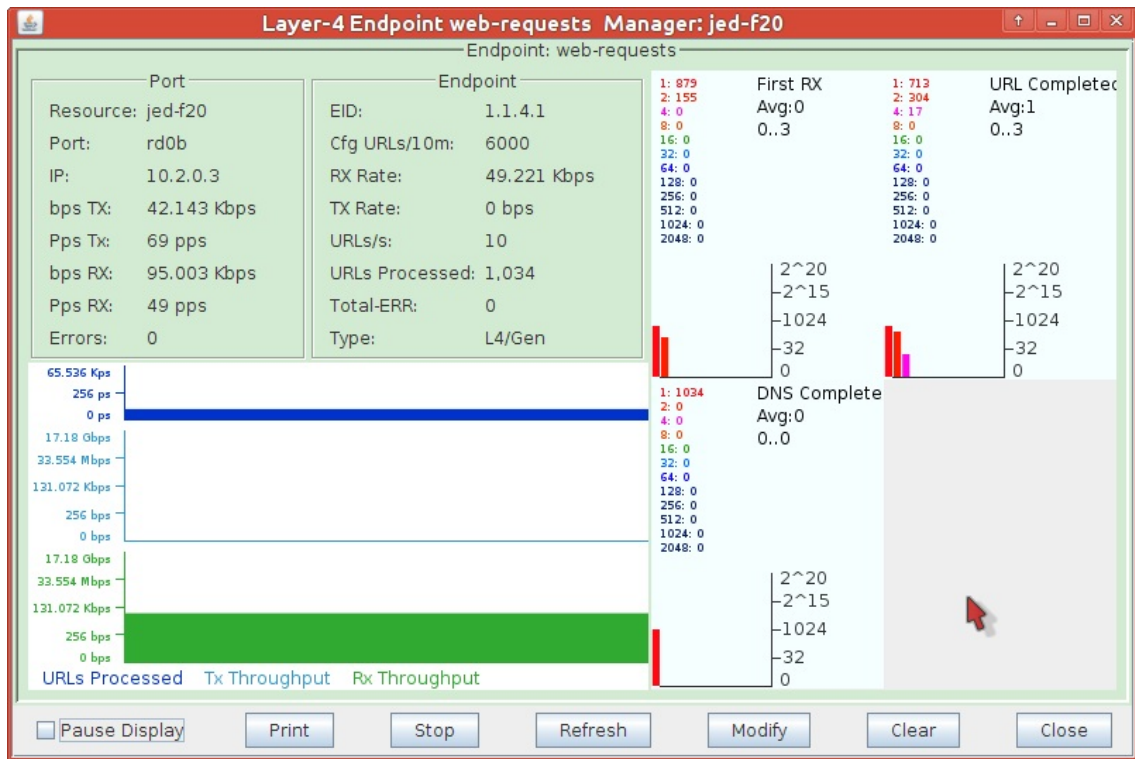

6. Running the traffic is simple:

A. Select the row named **web-requests** in the Layer 4-7 table,

B. Click the **Start** button.

- C. Click the **Display** button to see more detail on the traffic:

7. It is also possible to verify your connection setup from the command-line:

- A. To verify the Layer 3 connection, you can use ping:

```
ping -I 10.2.0.3 10.2.0.1
```

```
lanforge@jed-f20:/usr/local/lanforge/nginx/html - Terminal
[lanforge@jed-f20 html]$ ping -I 10.2.0.3 10.2.0.1
PING 10.2.0.1 (10.2.0.1) from 10.2.0.3 : 56(84) bytes of data.
64 bytes from 10.2.0.1: icmp_seq=1 ttl=64 time=0.077 ms
64 bytes from 10.2.0.1: icmp_seq=2 ttl=64 time=0.063 ms
64 bytes from 10.2.0.1: icmp_seq=3 ttl=64 time=0.039 ms
^C
--- 10.2.0.1 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2000ms
rtt min/avg/max/mdev = 0.039/0.059/0.077/0.018 ms
[lanforge@jed-f20 html]$
```

- B. To see that nginx is listening on port 80, use netstat on the resource running nginx and see what is listening on port 80:

```
sudo netstat -ntlp | grep ':80'
```

```
lanforge@jed-f20:/usr/local/lanforge/nginx/html - Terminal
[lanforge@jed-f20 html]$ sudo netstat -ntlp | grep ':80'
tcp        0      0 10.2.0.1:80          0.0.0.0:*           LISTEN      5034/nginx: master
[lanforge@jed-f20 html]$
```

- C. To see the output of the web request, you can use LANforge's version of curl located in /home/lanforge/local/bin/curl. Since it uses bundled libraries, first type:

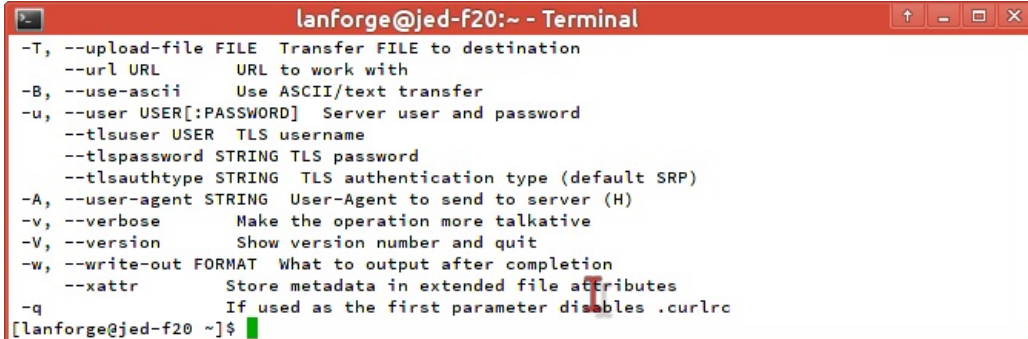

```
cd /home/lanforge && . ./lanforge.profile
```

This sets up all environment variables and paths to work with the binaries and libraries shipped with LANforge.

```
root@jed-f20:/home/lanforge
> cd /home/lanforge && . ./lanforge.profile
root@jed-f20:/home/lanforge
>
```

D. Verify it runs without complaint:

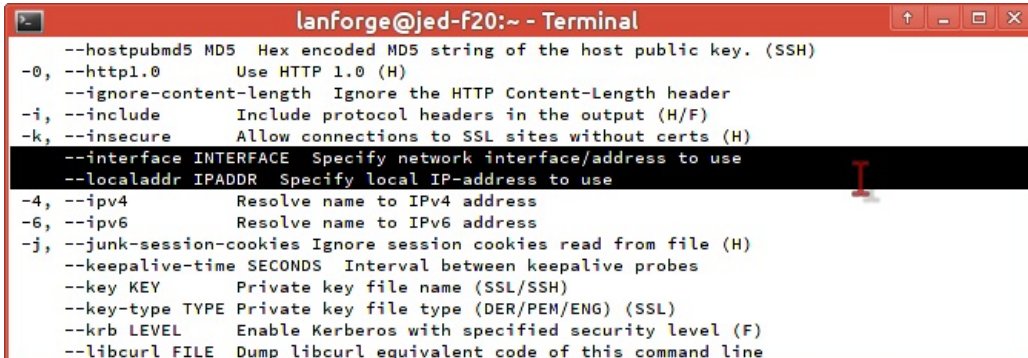

```
/home/lanforge/local/bin/curl --help
```

```
lanforge@jed-f20:~ - Terminal
-T, --upload-file FILE Transfer FILE to destination
--url URL URL to work with
-B, --use-ascii Use ASCII/text transfer
-u, --user USER[:PASSWORD] Server user and password
--tlshash ALGORITHM TLS hash algorithm
--tlshostname STRING TLS hostname
--tlspassword STRING TLS password
--tlsversion STRING TLS version (default 1.2)
--tlsv1.0 Enable TLS 1.0
--tlsv1.1 Enable TLS 1.1
--tlsv1.2 Enable TLS 1.2
--tlsv1.3 Enable TLS 1.3
-A, --user-agent STRING User-Agent to send to server (H)
-v, --verbose Make the operation more talkative
-V, --version Show version number and quit
-w, --write-out FORMAT What to output after completion
--xattr Store metadata in extended file attributes
-q If used as the first parameter disables .curlrc
[lanforge@jed-f20 ~]$
```

E. If you scroll up in your terminal, you will see options available in the output not found in a normal version of curl, like

--dns_server, --dns_interface, --dns_ip4_addr, --dns_ip6_addr, --interface and --localaddr. We will use --interface next.

```
lanforge@jed-f20:~ - Terminal
--hostpubmd5 MD5 Hex encoded MD5 string of the host public key. (SSH)
-0, --http1.0 Use HTTP 1.0 (H)
--ignore-content-length Ignore the HTTP Content-Length header
-i, --include Include protocol headers in the output (H/F)
-k, --insecure Allow connections to SSL sites without certs (H)
--interface INTERFACE Specify network interface/address to use
--localaddr IPADDR Specify local IP-address to use
-4, --ipv4 Resolve name to IPv4 address
-6, --ipv6 Resolve name to IPv6 address
-j, --junk-session-cookies Ignore session cookies read from file (H)
--keepalive-time SECONDS Interval between keepalive probes
--key KEY Private key file name (SSL/SSH)
--key-type TYPE Private key file type (DER/PEM/ENG) (SSL)
--krb LEVEL Enable Kerberos with specified security level (F)
--libcurl FILE Dump libcurl equivalent code of this command line
```

F. Craft your download command: `cd /home/lanforge/local/bin`

```
./curl --interface 10.2.0.3 'http://10.2.0.1/index.html'
```

```
lanforge@jed-f20:~/local/bin - Terminal
[lanforge@jed-f20 ~]$
[lanforge@jed-f20 ~]$ cd /home/lanforge/local/bin
[lanforge@jed-f20 bin]$ ./curl --interface 10.2.0.3 'http://10.2.0.1/index.html'
```

G. You will see the html output in the terminal:

```
lanforge@jed-f20:~/local/bin - Terminal
[lanforge@jed-f20 ~]$ cd /home/lanforge/local/bin
[lanforge@jed-f20 bin]$ ./curl --interface 10.2.0.3 'http://10.2.0.1/index.html'
<!DOCTYPE html>
<html>
<head>

[lanforge@jed-f20 logs]$
```

8. [Advanced] Creating IPv6 traffic to `nginx`. We will assume a scenario where `eth1` will serve nginx requests and `eth2` will generate requests.

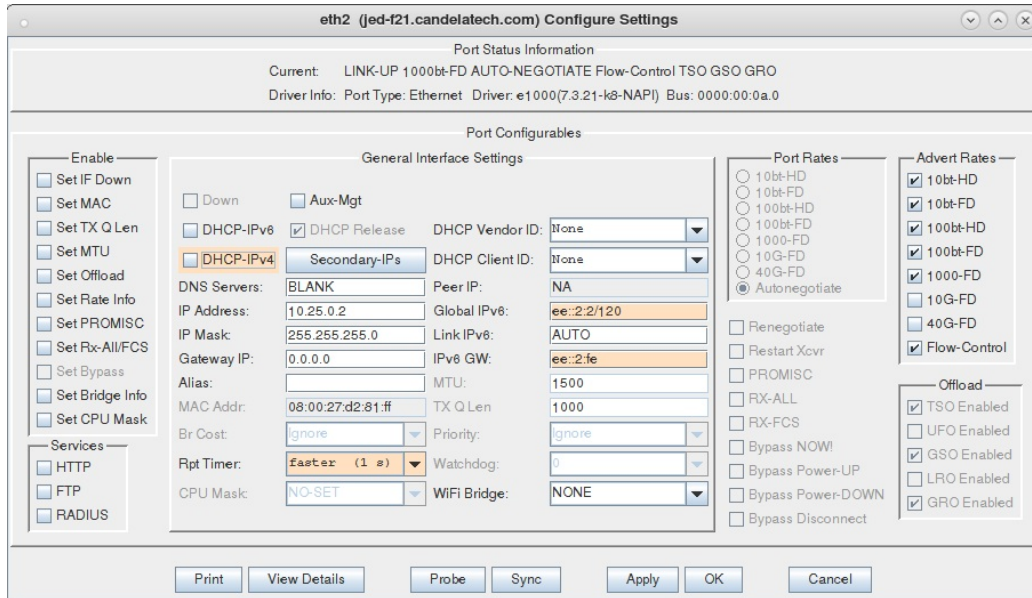

A. Add IPv6 addresses to your ports. We will add

- `ee::2:1/120` for `eth1`,
- `ee::2:2/120` for `eth2`,
- and set the gateways for them to `ee::2:fe`. We won't actually use a gateway, but our port configuration requires it.

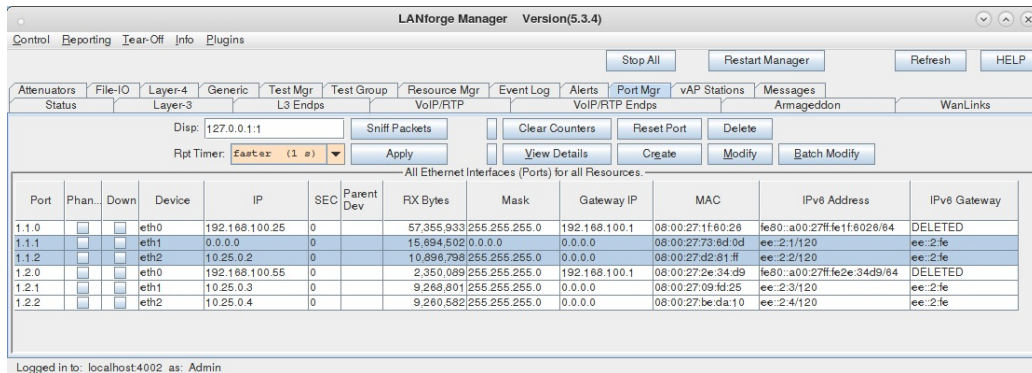

A. Here is eth1, and we will enable the **HTTP** service as well.

B. Here is eth2, notice how we added an IPv4 address to the port. Do that so that the Create Layer 4-7 dialog does not complain.

C. Here is a picture of the Port Mgr tab, with ports on two resources configured.

D. Verify your connection between ports using ping6: `$ ping6 -I ee::2:2%eth2 ee::2:1`

- B. Edit your `/home/lanforge/vr_conf/nginx_eth1.conf` file. You will remove the header comment and alter the `listen` statements to include IPv6 addresses. You can listen for `[::]` or you could listen for `[ee::2:1]`

```

1 worker_processes      1;
2 error_log logs/eth1_error.log;
3 pid                   /home/lanforge/vr_conf/nginx_eth1.pid;
4 events {
5     worker_connections 1024;
6 }
7
8 http {
9     include            /usr/local/lanforge/nginx/conf/mime.types;
10    default_type       application/octet-stream;
11    access_log logs/eth1_access.log;
12    sendfile           on;
13    keepalive_timeout  65;
14
15    server {
16        listen          0.0.0.0:80 bind_dev=eth1;
17        listen          [::]:80 bind_dev=eth1;
18        server_name     ww6-eth1;
19        access_log      logs/eth1_host.access.log;
20
21        location / {
22            root         html;
23            index        index.html index.htm;
24        }
25        error_page      500 502 503 504 /50x.html;
26        location = /50x.html {
27            root         html;
28        }
29    }
30 }

```

- C. If you provide an IPv6 address, please watch the nginx log file for errors: listening on an IPv6 address is easy to misconfigure. The log files can be found in `/usr/local/lanforge/nginx/logs`
- D. Re-start the http service on `eth1` by un-checking **HTTP**, clicking **Apply**, checking **HTTP**, clicking **OK**.
- E. Configure your Layer 4-7 endpoint:

- A. Name your endpoint
- B. Set your URLs per Minute
- C. Specify the URL with brackets around the address: `http://[ee::2:1]/index.htm`
- D. Set your output file to `/dev/null`

- F. You can watch traffic on `eth1` or `eth2` to verify the web requests.
